Insertion is better than clamps with IMS-Solar insertion system

IMS-Solar produces generally applicable mounting systems which exert no negative pressure on solar panels. The systems are appropriate on all sorts of roofs and in all formats. Also, it contributes to a longer life span of the installation.

Why is inserting a solar panel better than clamping it?

- No cracks in the glass
- Avoid microcracks
- No continuous pressure
- More Wp capacity per m² surface area
- Avoid delamination
- Better distribution of the weight on the roof

Benefits of a cross joint

- The weight of the solar panels is better distributed over the roof. As a result, there is no point load.
- There is space and flexibility for concealing cabling and optimizers.
- Cross-distribution provides flexibility in terms of the attachment points on the roof.
- The system can be constructed as a landscape or portrait installation.

Benefits of installing directly on steel

- This system is proven to be the fastest to install, thanks to the small amount of materials required.
- Installation as portrait or landscape orientation is possible.
- The installation provides good ventilation due to the chimney effect.

Benefits for privates

- The use of cross joints provides a more attractive appearance and is better for the roof structure.
- Available in black as well as aluminium.
- Has a distinctive character for the installer.
- Uses considerably less roof hooks than other installations.
